Ахнантоидные диатомовые

Achnanthes smithiana (Grev.) Toyoda et D.M. Williams
из Toyoda, Williams, 2005

Цели работы

- Проследить развитие систематики ахнантоидных диатомовых с конца XX века и до настоящего времени
- Выявить, на основании каких признаков осуществлялось выделение новых таксонов
- Рассмотреть, как изменилось положение ахнантоидных родов в системе диатомовых водорослей за последние десятилетия
- Сделать обзор данных по молекулярной филогенетике группы

Новые роды ахнантоидных диатомовых и критерии их выделения

FOUR NEW GENERA BASED ON *ACHNANTHES* (*ACHNANTHIDIUM*) TOGETHER WITH A RE-DEFINITION OF *ACHNANTHIDIUM*

The genus *Achnanthidium* comprises a collection of monoraphid species common in freshwaters and less so in marine habitats, though the latter are relatively uninvestigated as far as this genus is concerned. We propose that *Achnanthidium* be confined to the taxa around *A. minutissima*. Some of the remaining taxa are transferred to four new genera, *Planothidium*, *Rossithidium*, *Karayevia* and *Kolbesia*. This still leaves a large number of species to be re-allocated and these, for the moment, will have to be left as *Achnanthidium sensu lato*.

INTRODUCTION

Whilst studying samples of freshwater epipsammic diatoms it became quite clear that the genus *Achnanthidium* (Round *et al.* 1990) based on the listing of this genus in the *Index Nominum Genericorum* (see Ross & Sims in Round *et al.* 1990, p. 682) was simply impossible to characterise at the generic level on the detail of the valve morphology. The only single unifying feature was the araphid/raphid heterovalv but that itself is merely a feature of the higher order Achnanthales. *Achnanthidium* is based on *A. microcephalum* Kütz. and this and some related species are the only ones which we believe should be included in *Achnanthidium*. Following the establishment of *Psammothidium* Bukht. & Round (Bukhtiyarova & Round 1996), our ecological studies could not be published using names which were unacceptable within a restricted concept of *Achnanthidium*. Thus since *Achnanthidium sensu lato* does not cover all other "achnanthoid" taxa it is necessary to redefine this genus and the name was fortunately applied to *A. microcephala* by Kützing (1844); the minute illustrations leave no doubt about the capitate species involved. From this basis a cluster of species belonging to *Achnanthidium* can be defined along the lines already suggested by Krammer & Lange-Bertalot (1991).

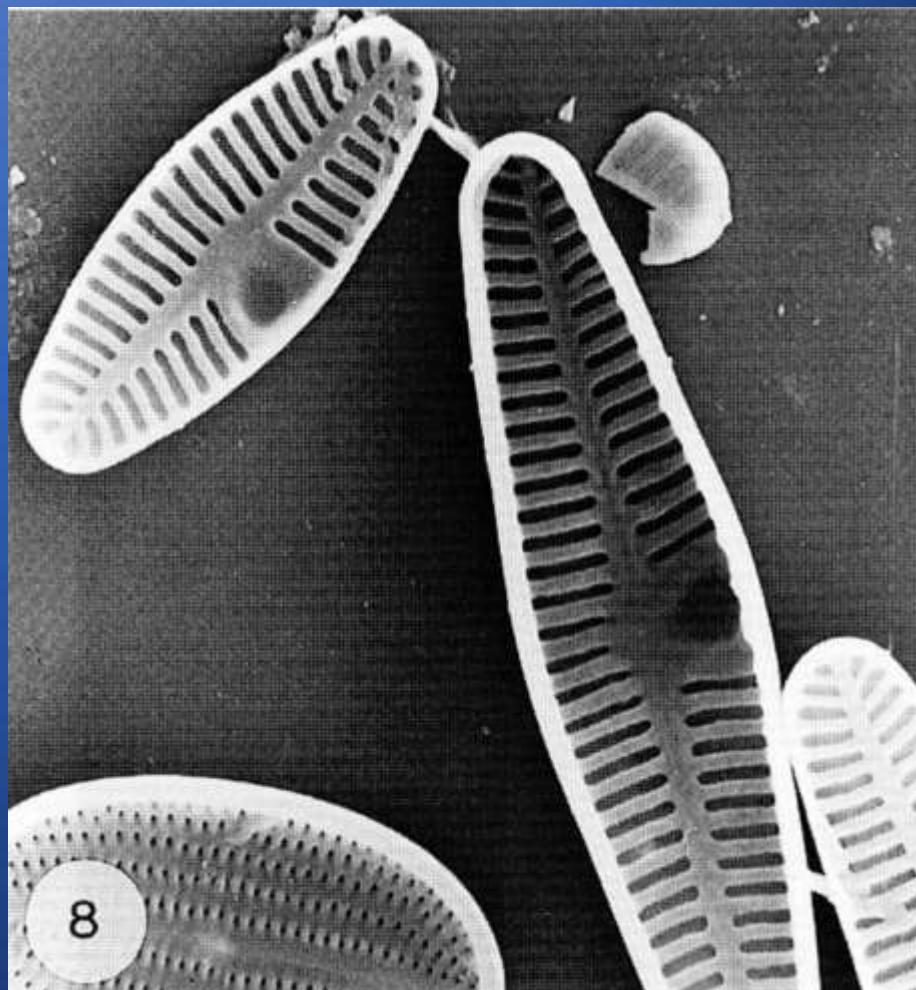

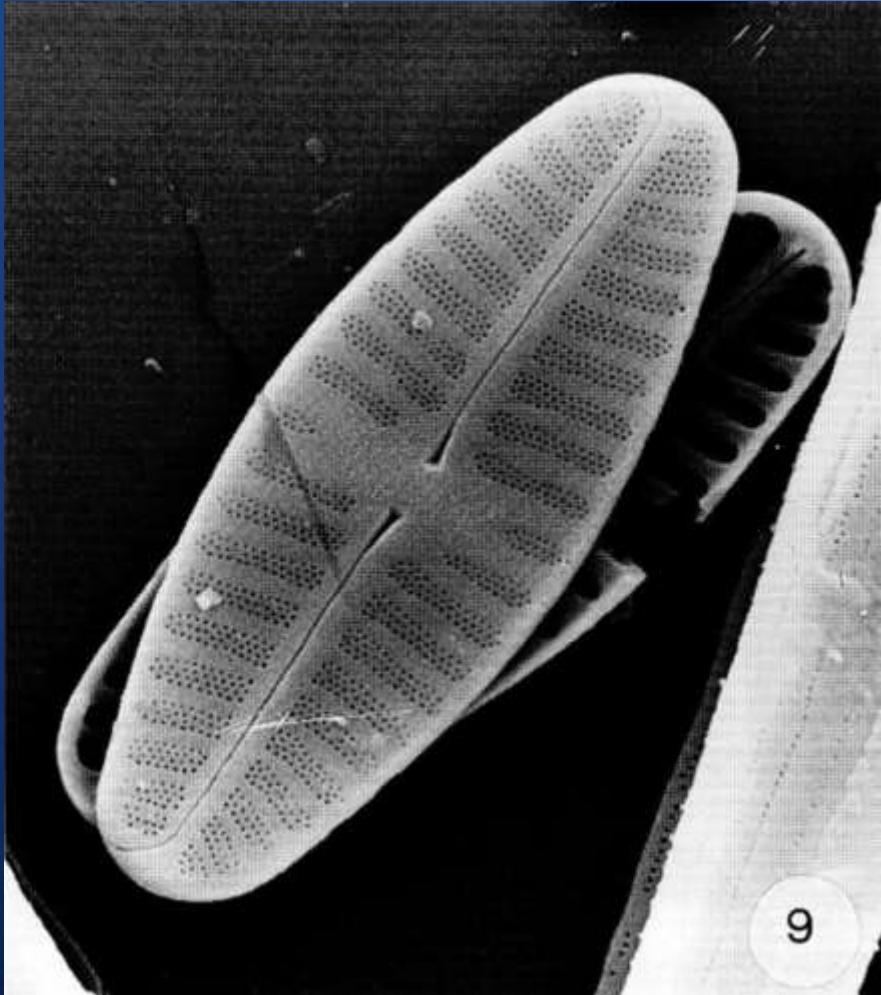

Kützing used *Achnanthes minutissima* Kütz. for a non-capitate taxon which was figured attached to the stalks of *Gomphonema germinatum* (= *Didymosphenia geminata* of modern works) – it

A NEW MONORAPHID DIATOM GENUS (*POGONEIS*)
FROM BAHRAIN AND THE TRANSFER OF
PREVIOUSLY DESCRIBED SPECIES *A. HUNGARICA*
AND *A. TAENIATA* TO NEW GENERA

F. E. Round & P. W. Basson

School of Biological Sciences, University of Bristol,
Bristol BS8 1UG, England

A new monoraphid genus (*Pogoneis*) is described from a sample of epiphyton growing on the red alga *Sarconema filiforme*. Its relationship to other achnanthoid species was studied and two of these also proved to require allocation to new genera. *Achnanthes hungarica* was therefore transferred to *Lemnicola* nov. gen. and the marine taxon *A. taeniata* to *Pauliella* nov. gen.

INTRODUCTION

In samples collected for a study of diatoms around the island of Bahrain (Arabian Gulf), an unusual monoraphid taxon was observed in which, apart from the normal occurrence of raphid and araphid valves, there was further noticeable heterovalvy – the raphid valve having distinctly upturned apices, rather like the prow of a ship, and the araphid valve apices being curved downwards. In addition, the bend about the transapical axis which is common in many *Achnanthes* and *Achnanthidium* species is absent in the new taxon.

Using valve shape as a good criterion of specific affinity the only obvious "achnanthoid" species which may have shown a close relationship with the form collected in Bahrain were *Achnanthes hungarica* and *A. taeniata*. Hence these were re-investigated and they proved to have little in common with the Bahrain taxon and nothing in common with the newly defined taxa in papers by Bukhtiyarova & Round (1996) and Round & Bukhtiyarova (1996). They have therefore been allocated to new genera.

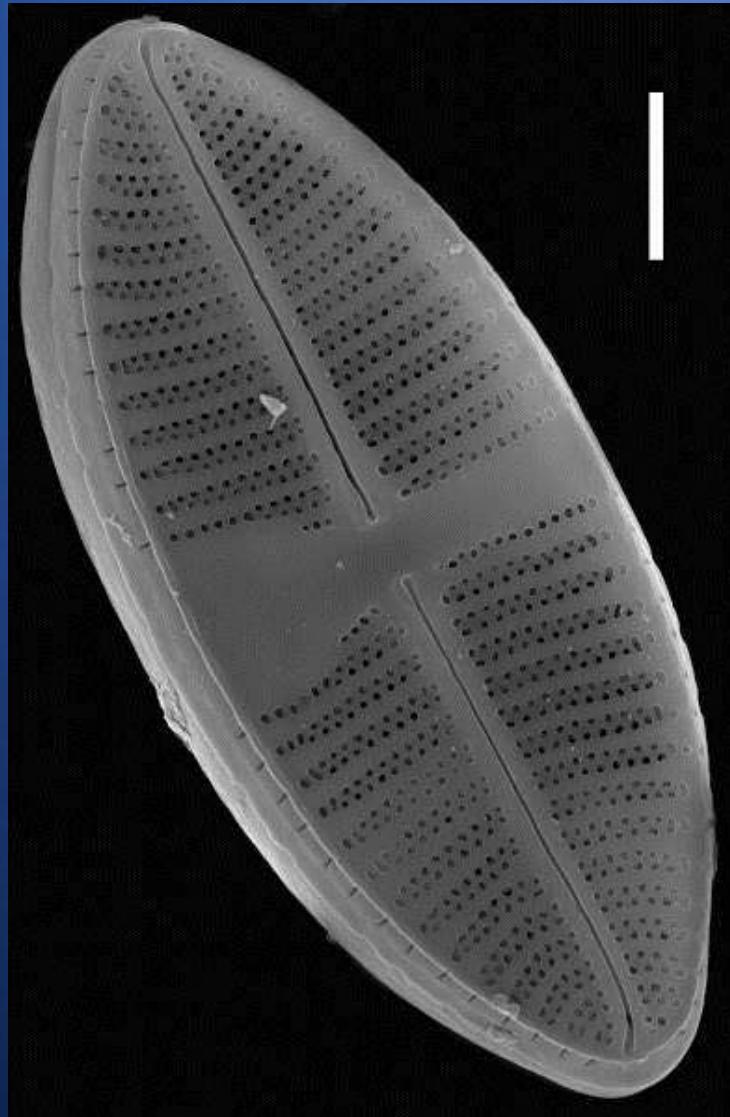

MATERIAL AND METHODS

Samples of the red alga *Sarconema filiforme* (Sonder) Kylin from the lower intertidal on the southwest side of Tubli Bay, Bahrain and samples of the floating freshwater *Lemna minor* from drainage ditches south of Bristol were collected. A cleaned sample of *A. taeniata* from the Baltic was kindly supplied by Dr P. Snoeijs. Small subsamples of the plants were treated with saturated potassium permanganate followed by the addition of concentrated hydrochloric acid and heating to 70°C. After repeated rinsing with distilled water and centrifugation, samples were dried onto

Данные по молекулярной филогенетике ахнантоидных диатомовых

Филогенетическое древо диатомовых водорослей по Witkowski et al, 2016

Заключение

- На данный момент группа ахнантоидных диатомовых состоит из 20 родов, включая непосредственно *Achnanthes* s.str.
- За последние десятилетия было описано и выделено 19 ахнантоидных родов.
- Основные признаки, по которым данные таксоны отличаются друг от друга, включают форму, размеры и рельеф панциря, характер штрихов и структуру составляющих их ареол, и форму шва.
- Основным выводом, сделанным на основе молекулярных исследований, было то, что моношовные диатомовые являются полифилетичной группой внутри клады пеннатных. Непосредственно род *Achnanthes* сближен с нитшиоидными диатомовыми, другие ахнантоидные рода были отнесены к другим кладам.

Спасибо за внимание!
